

19 urban flux towers (Urban-PLUMBER) both schemes compress the cross-site gradient

nocturnal radiometric surface–air offset

same radiometric inversion

TEB and CLM-Urban
run offline at every
site, default materials

same output,
three verdicts

- temporal skill high for both
- mean bias and benchmarks favour CLM-Urban
- cross-site gradient neither scheme

per-site scores do not
see the cross-site gap

organizes along site albedo (16-record core): $r = -0.77$, -2.7 K per 0.1 albedo
